

IN THE CLAIMS:

The text of all pending claims, (including withdrawn claims) is set forth below. Cancelled and not entered claims are indicated with claim number and status only. The claims as listed below show added text with underlining and deleted text with ~~strike through~~. The status of each claim is indicated with one of (original), (currently amended), (cancelled), (withdrawn), (new), (previously presented), or (not entered).

Please AMEND claims 1, 7, 8 and 16-21 in accordance with the following:

1. (currently amended) A method for collecting documents linked to each other from a network by crawling the network, comprising:

collecting first documents equal to or larger, in number, than a predetermined value from inside a community through the network based on a reference relation of the first documents, the reference relation defining a relationship between the first documents and second documents inside or outside the community linked to the first documents; and

collecting third documents from inside and outside the community based on the reference relation of ~~collected the first~~ documents after collecting the first documents equal to or larger in number than the predetermined value from inside the community.

2. (currently amended) The method according to claim 1, further comprising:

computing a significance level indicating a level of significance of ~~the a~~ collected document according to the reference relation of the collected document, and information about a position of the collected document in the network; and

determining a new document to be collected based on the reference relation and the significance level.

3. (currently amended) The method according to claim 2, wherein said collecting of the third documents ~~to be collected~~ is determined separately for inside the community and for outside the community.

4. (currently amended) The method according to claim 3, further comprising:

presenting a result of retrieving the ~~collected third~~ documents separately for inside the community and outside the community.

5. (currently amended) The method according to claim 2, further comprising:
determining whether ~~or not~~ any of the documents is in the community according to information indicating the position of the document in the network.

6. (cancelled)

7. (currently amended) A method for collecting documents linked to each other from a network by crawling the network, comprising:

providing a positive sample document group ~~which is a document group~~ relating to a field, and a negative sample document group ~~which is a document group~~ less related to the field;

determining a prospective document ~~which is to be collected and for collection that is~~ related to the field based on a reference relation to the positive sample document group and the negative sample document group by computing a reference score indicating a level at which a the prospective document is referenced only by ~~a~~ at least one document in the positive sample document group based on the reference relation which defines a relationship between original documents and linked documents belonging to the positive sample document group or to the negative sample document group which are linked to the original documents; and

collecting ~~a~~ the prospective document having a high reference score ~~as the document to be collected~~.

8. (currently amended) A method for collecting documents linked to each other from a network by crawling the network, comprising:

providing a positive sample document group ~~which is a document group~~ relating to a field, and a negative sample document group ~~which is a document group~~ less related to the field;

determining a prospective document ~~which is to be collected and for collection that is~~ related to the field based on a reference relation to the positive sample document group and the negative sample document group by computing a co-reference score indicating a level at which ~~a~~ the prospective document is referenced together with a first collected document in the positive sample document group for a second collected document referenced by a third collected document referring to a fourth collected document in the positive sample document group based on the reference relation which defines a relationship between original documents and linked documents belonging to the positive sample document group or to the negative sample document group which are linked to the original documents; and

collecting a the prospective document having a high co-reference score ~~as the document to be collected~~.

9. (cancelled)

10. (previously presented) The method according to claim 1, further comprising:
summarizing the collected documents based on a referencing expression used in the collected documents.

11. (previously presented) The method according to claim 1, further comprising:
assigning a keyword to the collected documents based on a referencing expression used in the collected documents.

12. (original) The method according to claim 1, further comprising:
not assigning a keyword based on the referring expression when the referencing expression is used regardless of a content of a referenced document.

13. (original) The method according to claim 11, further comprising:
counting a number of different documents referenced using the referencing expression;
and
not assigning the keyword based on the referencing expression when the number of different documents is equal to or larger than a predetermined value.

14. (original) The method according to claim 11, further comprising:
counting a reference frequency at which each collected document is referenced by the referencing expression when the number of different documents is smaller than a predetermined value; and
determining whether or not the referencing expression is assigned as the keyword based on the number of different documents and the reference frequency.

15. (original) The method according to claim 11, further comprising:
combining the keyword based on the referencing expression with a keyword extracted from text of the collected document, and a keyword extracted from information indicating a position in the network about the collected document.

16. (currently amended) A method for retrieving documents linked to each other from a terminal belonging to a community in a network by crawling the network, comprising:

transmitting information for retrieval of the documents to a server; and

receiving the documents retrieved separately from inside and outside the community according to the information for retrieval together with information indicating a significance level for the community, the significance level indicating a relationship between original documents and other documents inside or outside the community which are linked to the original documents.

17. (currently amended) A document collection apparatus collecting documents linked to each other from a network by crawling the network, comprising:

a next prospect determination unit determining a prospect to be collected next based on a reference relation of a collected document, the reference relation defining a relationship between original documents and other documents inside or outside the community which are linked to the original documents;

a community determination unit determining whether or not the prospect is in a community in the network according to information indicating a position in the network of the prospect; and

a document collection unit collecting the prospect from the network, wherein said document collection unit collects the prospect from inside and outside the community after collecting documents larger in number than a predetermined value from inside the community.

18. (currently amended) A document collection apparatus collecting documents linked to each other from a network by crawling the network, comprising:

a next prospect determination unit determining a prospect to be collected next based on a reference relation between a positive sample document group which is a document group related to a field and a negative sample document group which is a document group less related to the field; and

a document collection unit collecting the prospect from the network; wherein the reference relation is a relationship between original documents and other documents belonging to the positive sample document group or to the negative sample document group which are linked to the original documents.

19. (currently amended) A computer-readable recording medium recording a program used to direct a computer to control collection of documents linked to each other from a network by crawling the network, comprising:

collecting first documents equal to or larger, in number, than a predetermined value from a community through the network based on a reference relation of the first documents, the reference relation defining a relationship between the first documents and second documents inside or outside the community which are linked to the first documents; and

collecting third documents from inside and outside the community based on the reference relation of ~~collected the first~~ documents after said collecting of the first documents equal to or larger, in number, than the predetermined value from inside the community.

20. (currently amended) A computer-readable recording medium recording a program used to direct a computer to control collection of documents linked to each other from a network by crawling the network, comprising:

providing a positive sample document group which is a document group relating to a field, and a negative sample document group which is a document group less related to the field;

determining a document to be collected relating to the field based on a reference relation to the positive sample document group and the negative sample document group, the reference relation defining a relationship between original documents and other documents inside or outside the community which are linked to the original documents; and

collecting the document to be collected from the network.

21. (currently amended) A computer data signal embodied on a carrier expressing a program used to direct a computer to control collection of documents linked to each other from a network by crawling the network, said program instructing the computer to perform the process comprising:

collecting first documents equal to or larger than, in number, a predetermined value from inside a community in the network based on a reference relation of the first documents, the reference relation defining a relationship between the first documents and second documents inside or outside the community which are linked to the first documents; and

collecting third documents from inside and outside the community based on the reference relation of ~~collected the first~~ documents after said collecting of the first documents equal to or larger, in number, than the predetermined value from the community.
